* ↑, ↓, and → indicate an increase, a decrease, and the same level, respectively, compared to the previous week.

* The positive rate is calculated mechanically with the number of new positive tests (including patients with pseudo-symptoms) based on the publication date in each prefecture as the numerator, and the number of PCR tests (including tests at discharge) as the denominator. The results may exceed 100% due to the influence of delay in reporting the number of PCR tests, and attention should be paid to the interpretation of the results in other prefectures as well.
