\* ↑, ↓, and → indicate an increase, a decrease, and the same level, respectively, compared to the previous week.

\* The number of tests represents the total number, including tests at the time of discharge. In particular, the “Number of persons who underwent an antigen test (sampling) (counted for each prefecture by public health institutes/public health centers and universities/medical facilities)” is added to the existing “Number of PCR tests performed (counted for each prefecture by public health institutes/public health centers, private inspection laboratories, and universities/medical facilities)” from March 21, 2022.

\* The positive rate is calculated mechanically, with the number of new positive tests (including patients with pseudo-symptoms) based on the publication date in each prefecture as the numerator, and the number of tests (including tests at discharge) as the denominator. The results may exceed 100% due to the influence of delays in reporting the number of tests, so attention should be paid to interpreting the results in other prefectures.
